

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

PREFACE.

THIS book has been prepared to meet a generally-expressed wish for more problems than are found in most text-books on Algebra. It contains about 4500 problems, classified by subjects, and including all the topics usually taught in schools. The exercises have been selected mainly from the rich French collection of Morf and Tzaut. The simplest and the most difficult of the 12,000 problems in that collection have been rejected, and it is believed that these exercises will be not only new to American teachers but well adapted to their wants.

The book may be used in connection with any Algebra for supplementary or review work; and, in order that it may be brought within the reach of scholars as well as teachers, the price has been made as low as possible.

(1) This series is the development of e^x ; and, if $x=1$, it gives the value of e , the base of the system of Napierian logarithms.

(2) This series, known by the name of the Leibnitz series, gives the value of π ; but a great number of terms must be calculated to obtain a near approximation.

(3) This series gives the value of the sine of an angle in the function of the arc x , reduced to the radius.

(4) This series, if $n=1$, gives the Napierian logarithm of 2.

and what is the fraction that remains ?

21. When, in the preceding example, we have $x < \frac{1}{2}$, we also have $\frac{x^n}{1-x} < x^{n-1}$. If, then, $2x^{n-1}$ is small enough not to affect the degree of exactness proposed, we can stop at the $n-1$ th term, and write:

$$\frac{1}{1-x} = 1 + x + x^2 + \dots + x^{n-1}.$$

Application: change $\frac{1}{0.97}$ into a decimal fraction, exact to the seventh figure.

22. When $\frac{1}{x}$ is small, since $\frac{a}{x+b} = \frac{a}{x} - \frac{ab}{x^2} + \frac{ab^2}{x^3} - \dots$ a quantity in a decimal fraction can be developed by approaching rapidly with the aid of this formula to a given degree of approximation. Ex.: reduce $\frac{3}{167}$ to a decimal fraction, exact to the units of the sixth decimal place.

23. Reduce $\frac{3}{164}$ to a decimal fraction, exact to the ten millionths.

24. Change $\frac{5}{0.98}$ to a decimal fraction, exact to the eighth figure.

25. Change $\frac{7}{0.995}$ to a decimal fraction, exact to the twelfth figure.

26. Change $\frac{3}{1661}$ to a decimal fraction, exact to the thirteenth figure.

27. Reduce to a decimal fraction: $\frac{1 + \frac{2}{3\frac{1}{2}}}{1 - \frac{2}{3\frac{1}{2}}} \div \left(1 + \frac{4}{9 - \frac{3}{1 - \frac{3}{8}}} \right)$.

If, at the end of each year, commencing in a year, there is placed during n years a sum s , at compound interest, the value S of all these annuities and of their interests is given by the formula

$$S = \frac{s}{r} [(1 + r)^n - 1].$$

If to-day there is placed a capital C , and each year, to commence in a year, s dollars are added to this capital, at the end of n years the value of S is given by the formula

$$S = C(1+r)^n + \frac{s}{r} [(1+r)^n - 1].$$

It follows that, to pay in n years, by an annuity s , commencing in one year, a capital C borrowed to-day, we have

$$C(1+r)^n = \frac{s}{r} [(1+r)^n - 1].$$

The actual value A , which must be given to-day to buy up an annuity of s dollars, is given by the following formulas. If the annuity commences:

1. In one year to be perpetual,

$$A = \frac{s}{r}.$$

2. In $(m+1)$ years to be perpetual,

$$A = \frac{s}{r(1+r)^m}.$$

3. In one year to cease in m years,

$$A = \frac{s}{r} - \frac{s}{r(1+r)^m} = \frac{s[(1+r)^m - 1]}{r(1+r)^m}.$$

4. In $(m+1)$ years and ceases p years later,

$$A = \frac{s}{r(1+r)^m} - \frac{s}{r(1+r)^{m+p}} = \frac{s[(1+r)^p - 1]}{r(1+r)^{m+p}}.$$

Find, in the following developments, the term required :

121. The seventh term of $(2 + a)^{16}$.

122. The eleventh term of $(a + d)^{21}$.

123. The sixth term of $(3 + 2x^2)^9$.

124. The twelfth term of $(a^2 - 3x^5)^{30}$.
125. The eighteenth term of $(1 + x^2)^{80}$.
126. The fourteenth term of $(y^3 - 1)^{40}$.
127. The seventh term of $(\frac{1}{2}a - \sqrt{x^3})^{17}$.
128. The fourth term of $(\sqrt{a} - \sqrt[3]{x^2})^{11}$.
129. The sixth term of $(\sqrt{a} - ix)^{13}$.
130. The thirtieth term of $(b - 2c^2)^{60}$.
131. Prove that the coefficient of the n th term from the beginning is equal to the coefficient of the n th term from the end.
132. What is the greatest coefficient in the development of $(1 + x)^m$?
133. What is the greatest coefficient of the development of
i. $(a + b^3)^{11}$? ii. $(b + x^2)^{16}$? iii. $(1 + y^5)^{33}$?
134. Prove that, in the development of $(1 + a)^m$, the sum of the coefficients of even places is equal to the sum of the coefficients of odd places.
135. Prove that, in the development of $(1 + x)^m$, the sum of the coefficients of the terms in x is equal to $2m - 1$.

Instead of $(a + b)^m$ we can write $a^m \left(1 + \frac{b}{a}\right)^m$; or, replacing in the parenthesis, $\frac{b}{a}$ by x , we can develop a quantity of the form $(1 + x)^m$.

After the preceding formula (A), we have (B):

$$\begin{aligned}(1 + x)^m &= 1 + \frac{m}{1}x + \frac{m(m-1)}{1 \times 2}x^2 + \frac{m(m-1)(m-2)}{1 \times 2 \times 3}x^3 \\ &\quad + \frac{m(m-1)(m-2)(m-3)}{1 \times 2 \times 3 \times 4}x^4 + \dots\end{aligned}$$

If m is a negative integral number, or a positive or negative fraction, the number of the terms of the second member of (B) is unlimited. If, in absolute value, $x > 1$, this second member increases

indefinitely, and cannot be equal to the first member, whose value is finite.

In the development of $\frac{1}{1-x}$, we have

$$\frac{1}{1-x} = (1-x)^{-1} = 1 + x + x^2 + x^3 + \dots$$

When $x = 2$, the first member is negative, while the second is positive and indefinitely increasing.

If, in absolute value, $x < 1$, the second member converges towards a fixed finite value, which is the value of the first member.

Then $(a+b)^m$ can be developed after the formula (A), where m is integral and negative, or fractional. Thus, if $a > b$, (C):

$$\begin{aligned}(a+b)^m &= a^m \left(1 + \frac{b}{a}\right)^m = a^m + \frac{m}{1} a^{m-1}b + \frac{m(m-1)}{1 \times 2} a^{m-2}b^2 \\ &+ \frac{m(m-1)(m-2)}{1 \times 2 \times 3} a^{m-3}b^3 + \dots\end{aligned}$$

If $a < b$, it will be developed thus, (D):

$$(a+b)^m = b^m \left(1 + \frac{a}{b}\right)^m = b^m + \frac{m}{1} b^{m-1}a + \frac{m(m-1)}{1 \times 2} b^{m-2}a^2 + \dots$$

$$x = \frac{7}{12}; x = -0.09; x = \frac{1}{8}.$$

140. Develop $(1+x)^{-\frac{1}{3}}$, and then make :

$$x = -\frac{2}{11}; x = -0.002; x = -\frac{1}{8}.$$

WENTWORTH & HILL'S

EXAMINATION MANUALS.

No. II.

ALGEBRA.

BOSTON:

PUBLISHED BY GINN & COMPANY.

1896.

Entered, according to Act of Congress, in the year 1883,
BY GEORGE A. WENTWORTH AND GEORGE A. HILL,
In the Office of the Librarian of Congress at Washington.

J. S. CUSHING & Co., PRINTERS, BOSTON.

PREFACE.

THIS Manual consists of two parts: The first part contains one hundred and fifty examination papers, the questions for which have been selected mainly from the best English, French, and German collections of problems. These papers may be divided into three groups. The first fifty papers embrace the subjects of Elementary Algebra as far as Quadratic Equations; the next fifty papers also include Quadratic Equations and Radical Expressions; the last fifty papers extend over still more ground, including several topics usually regarded as belonging to Higher Algebra.

In each of these groups the earlier papers will be found somewhat easier than the later ones. The papers are intended to be *hour* papers, but if any of them are thought to be too long for one hour, the time may be increased or the length of the paper reduced by omitting one or more of the questions.

The second part of the Manual is a collection of recent papers actually set in various American and English institutions of learning.

There are two ways in which the Manual may be used.

First: To *test* the learner's knowledge in the usual way by means of an examination. For this purpose the class will come to the recitation-room provided with the Manual and blank books, and the teacher will simply designate by number the paper to be worked.

Secondly: To *exercise* the learner from day to day in the various rules and processes, to detect his weak points, and ascer-

tain where he most needs assistance. This may be done by assigning exercises to be worked in the class-room, or by assigning to each member of the class a paper with directions to hand in the solutions, neatly worked out, at a subsequent recitation.

The Manual will be found especially useful in reviewing the subject of Algebra, and in preparing for examinations.

Answers to the problems in the first one hundred and fifty papers, bound separately in paper covers, can be had by teachers *only*, on application to the publishers.

SPECIMEN PAPER WORKED OUT.

1. Simplify

$$\begin{aligned}
 & a - [2b + \{3c - 3a - (a + b)\} + \{2a - (b + c)\}] \\
 &= a - [2b + \{3c - 3a - a - b\} + \{2a - b - c\}] \\
 &= a - [2b + 3c - 3a - a - b + 2a - b - c] \\
 &= a - 2b - 3c + 3a + a + b - 2a + b + c \\
 &= 3a - 2c.
 \end{aligned}$$

Ans. $3a - 2c$.

2. Resolve into factors

$$\begin{aligned}
 & x^2 - y^2 + z^2 - a^2 - 2xz + 2ay \\
 &= (x^2 - 2xz + z^2) - (a^2 - 2ay + y^2) \\
 &= (x - z)^2 - (a - y)^2 \\
 &= \{(x - z) - (a - y)\} \{(x - z) + (a - y)\} \\
 &= (x - z - a + y)(x - z + a - y).
 \end{aligned}$$

3. Find the H.C.F. of

$$\begin{aligned}
 & 5x^3(12x^3 + 4x^2 + 17x - 3) \\
 & \text{and } 10x(24x^3 - 52x^2 + 14x - 1).
 \end{aligned}$$

$5x^3(12x^3 + 4x^2 + 17x - 3)$ $12x^3 + 4x^2 + 17x - 3$ $12x^3 + 4x^2 - \quad x$ <hr style="width: 100%;"/> $3 \overline{)18x - 3}$ $6x - 1$	$10x(24x^3 - 52x^2 + 14x - 1)$ $24x^3 - 52x^2 + 14x - 1$ $24x^3 + 8x^2 + 34x - 6$ <hr style="width: 100%;"/> $-5 \overline{) -60x^2 - 20x + 5}$ $12x^2 + 4x - 1$ $12x^2 - 2x$ <hr style="width: 100%;"/> $6x - 1$ $6x - 1$ <hr style="width: 100%;"/>	<div style="display: flex; justify-content: space-between;"> <div>Reserve $5x$</div> <div>2</div> </div> <div style="display: flex; justify-content: space-between; margin-top: 20px;"> <div>x</div> <div>$2x + 1$</div> </div>
--	---	---

Ans. $5x(6x - 1)$.

4. Simplify

$$\begin{aligned} & \frac{3}{1-2x} - \frac{7}{1+2x} - \frac{4-20x}{4x^2-1} \\ &= \frac{3}{1-2x} - \frac{7}{1+2x} - \frac{4-20x}{4x^2-1} \\ &= \frac{3}{1-2x} - \frac{7}{1+2x} + \frac{4-20x}{1-4x^2} \end{aligned}$$

$$\text{L.C.D.} = 1-4x^2.$$

$$3 + 6x = \text{first numerator,}$$

$$-7 + 14x = \text{second numerator,}$$

$$4 - 20x = \text{third numerator.}$$

$$0 = \text{sum of numerators.}$$

$$\text{Ans. } 0.$$

5. Solve

$$10x + 15y - 24z = 41 \quad (1)$$

$$15x - 12y + 16z = 10 \quad (2)$$

$$18x - 14y - 7z = -13. \quad (3)$$

$$\text{Multiply (1) by 2,} \quad 20x + 30y - 48z = 82$$

$$\text{Multiply (2) by 3,} \quad 45x - 36y + 48z = 30$$

$$\text{Add,} \quad 65x - 6y = 112 \quad (4)$$

$$\text{Multiply (2) by 7,} \quad 105x - 84y + 112z = 70$$

$$\text{Multiply (3) by 16,} \quad 288x - 224y - 112z = -208$$

$$\text{Add,} \quad 393x - 308y = -138 \quad (5)$$

$$\text{Multiply (4) by 154,} \quad 10010x - 924y = 17248$$

$$\text{Multiply (5) by 3,} \quad 1179x - 924y = -414$$

$$\text{Subtract,} \quad 8831x = 17662$$

$$\therefore x = 2.$$

$$\text{Substitute value of } x \text{ in (4),} \quad 130 - 6y = 112.$$

$$\therefore y = 3.$$

$$\text{Substitute values of } x \text{ and } y \text{ in (1), } 20 + 45 - 24z = 41.$$

$$\therefore z = 1.$$

$$\text{Ans. } x = 2, y = 3, z = 1.$$

6. A passenger train, after travelling an hour, is detained 15 minutes; after which it proceeds at three-fourths of its former rate, and arrives 24 minutes late. If the detention had taken place 5 miles farther on, the train would have been only 21 minutes late. Determine the usual rate of the train.

Let x = usual rate of train per hour,
 and y = number of miles train has to run.
 Then $y - x$ = number of miles train has to run after detention,
 $\frac{y-x}{x}$ = number of hours usually required to run $y - x$ miles.
 and $\frac{y-x}{\frac{3}{4}x}$ = number of hours actually required to run $y - x$ miles,

Since the detention was 15 minutes, and the train was 24 minutes late, the loss in running-time is 9 minutes, or $\frac{3}{10}$ of an hour.

$$\therefore \frac{y-x}{\frac{3}{4}x} - \frac{y-x}{x} = \frac{3}{20} \quad (1)$$

If the detention had occurred 5 miles farther on, the loss in running-time would have been 6 minutes, or $\frac{1}{10}$ of an hour.

$$\therefore \frac{y-x-5}{\frac{3}{4}x} - \frac{y-x-5}{x} = \frac{1}{10} \quad (2)$$

Simplify (1),

$$20y - 29x = 0$$

Simplify (2),

$$20y - 26x = 100$$

Subtract (1) from (2),

$$3x = 100$$

$$\therefore x = 33\frac{1}{3}$$

Ans. $33\frac{1}{3}$ miles.

7. Solve

$$\frac{1}{2x^2 + x + 1} + \frac{1}{2x^2 - 3x + 1} = \frac{a}{2bx - b} - \frac{2bx + b}{ax^2 - a}$$

$$\frac{1}{(2x-1)(x+1)} + \frac{1}{(2x-1)(x-1)} = \frac{a}{b(2x-1)} - \frac{2bx+b}{a(x-1)(x+1)}$$

$$\text{L.C.D.} = ab(x-1)(x+1)(2x-1).$$

$$\text{Simplify, } abx - ab + abx + ab = a^2x^2 - a^2 - 4b^2x^2 + b^2,$$

$$2abx = a^2x^2 - a^2 - 4b^2x^2 + b^2,$$

$$4b^2x^2 - a^2x^2 + 2abx = b^2 - a^2,$$

$$(4b^2 - a^2)x^2 + 2abx = b^2 - a^2.$$

Complete the square, multiplying by 4 times the coefficient of x^2 and adding the square of the coefficient of x ,

$$4(4b^2 - a^2)^2x^2 + () + (2ab)^2 = 16b^4 - 16b^2a^2 + 4a^4,$$

$$(4b^2 - a^2)2x + 2ab = \pm(4b^2 - 2a^2),$$

$$(4b^2 - a^2)2x = 4b^2 - 2ab - 2a^2,$$

$$\text{or } 2a^3 - 2ab - 4b^2.$$

$$x = \frac{2b^2 - ab - a^2}{4b^2 - a^2}, \text{ or } \frac{a^3 - ab - 2b^2}{4b^2 - a^2}.$$

$$\text{Ans. } x = \frac{b-a}{2b-a}, \text{ or } -\frac{b+a}{2b+a}.$$

8. Solve

$$x + y = 4 \quad (1)$$

$$x^4 + y^4 = 82 \quad (2)$$

Put $u + v$ for x , and $u - v$ for y .

(1) becomes

$$2u = 4$$

$$\therefore u = 2.$$

(2) becomes

$$u^4 + 16u^2v^2 + v^4 = 41 \quad (3)$$

Substitute 2 for u in (3),

$$16 + 24v^2 + v^4 = 41,$$

$$v^4 + 24v^2 = 25,$$

$$v^4 + () + 144 = 169,$$

$$v^2 + 12 = \pm 13,$$

$$v^2 = 1 \text{ or } -25,$$

$$v = \pm 1 \text{ or } \pm \sqrt{-25}.$$

$$\text{Ans. } \begin{cases} x = 3, 1, \text{ or } 2 \pm \sqrt{-25}, \\ y = 1, 3, \text{ or } 2 \mp \sqrt{-25}. \end{cases}$$

9. Show that $2\sqrt[3]{a^2b^2}$, $\sqrt[3]{ab^5}$, $\frac{1}{2}\sqrt[3]{\frac{a^6}{b}}$ are similar surds.

$$2\sqrt[3]{a^2b^2} = 2a\sqrt[3]{b^2},$$

$$\sqrt[3]{ab^5} = 2b\sqrt[3]{b^2},$$

$$\frac{1}{2}\sqrt[3]{\frac{a^6}{b}} = \frac{1}{2}\sqrt[3]{\frac{a^6b^2}{b^3}} = \frac{a^2}{2b}\sqrt[3]{b^2}.$$

Since they all have the same surd factor they are similar surds.

10. Simplify

$$\begin{aligned} & (2ab)^{\frac{1}{2}} \times (3ab^3)^{\frac{1}{3}} + (5ab^5)^{\frac{1}{5}} \\ &= (2ab)^{\frac{1}{2}} \times (3ab^3)^{\frac{2}{3}} + (5ab^5)^{\frac{1}{5}} \\ &= \sqrt[5]{(2ab)^2} \times \sqrt[5]{(3ab^3)^2} + \sqrt[5]{5ab^5} \\ &= \sqrt[5]{2^2a^2b^2} \times \sqrt[5]{3^2a^2b^6} + \sqrt[5]{5ab^5} \\ &= \sqrt[5]{2^2 \times 3^2 \times a^2 \times b^8} + \sqrt[5]{5ab^5} \\ &= \sqrt[5]{\frac{2^2 \times 3^2 \times a^2b^8}{5ab^3}} \\ &= \sqrt[5]{\frac{2^2 \times 3^2 \times 5^4a^4b^4}{5^5}} \\ &= \frac{1}{5}\sqrt[5]{225000a^4b^4}. \end{aligned}$$

$$\text{Ans. } \frac{1}{5}\sqrt[5]{225000a^4b^4}.$$

11. Expand $\left(\frac{2x^2}{y} - \sqrt[3]{y^2}\right)^6$.

$$\begin{aligned}\left(\frac{2x^2}{y} - \sqrt[3]{y^2}\right)^6 &= (2x^2y^{-1} - y^{\frac{2}{3}})^6, \\ (2x^2y^{-1} - y^{\frac{2}{3}})^6 &= (2x^2y^{-1})^6 - 6(2x^2y^{-1})^5(y^{\frac{2}{3}}) + 15(2x^2y^{-1})^4(y^{\frac{2}{3}})^2 \\ &\quad - 20(2x^2y^{-1})^3(y^{\frac{2}{3}})^3 + 15(2x^2y^{-1})^2(y^{\frac{2}{3}})^4 \\ &\quad - 6(2x^2y^{-1})(y^{\frac{2}{3}})^5 + (y^{\frac{2}{3}})^6 \\ &= 64x^{12}y^{-6} - 192x^{10}y^{-\frac{12}{3}} + 240x^8y^{-\frac{8}{3}} - 160x^6y^{-1} \\ &\quad + 60x^4y^{\frac{2}{3}} - 12x^2y^{\frac{4}{3}} + y^2.\end{aligned}$$

Ans. $64x^{12}y^{-6} - 192x^{10}y^{-4} + 240x^8y^{-\frac{8}{3}} - 160x^6y^{-1} + 60x^4y^{\frac{2}{3}} - 12x^2y^{\frac{4}{3}} + y^2$, etc.

 (ii.) $3, 2\frac{1}{8}, 1\frac{3}{8}, \dots$
 (iii.) $\frac{1}{2 \times 3}, \frac{1}{3 \times 4}, \frac{1}{4 \times 5} \dots$
11. Distinguish between permutations and combinations, and find the number of the latter that can be formed from n things taken r together.
